both methionine, choline

In 60 seconds

Two-dose protocol: Zoetis is giving swine veterinarians and pork producers another on-label vaccination option by making Respisure-ONE available for a two-dose protocol. With the new label indication, Respisure-ONE can be administered intramuscularly with a 1 mL injection at processing. Respisure-ONE is licensed for the vaccination of healthy swine one day of age or older as an aid in reducing chronic pneumonia caused by Mycoplasma hyopneumoniae, a common bacterial pathogen that infects up to 80% of swine around the world. It can reduce average pig mortality and decrease feed efficiency. The bacteria typically transfers from sow to piglet during lactation as well as from older to younger pigs.

Encapsulated niacin: Vertellus said the coating is durable but digestible and breaks down fully in the intestines. Niacin has been shown to benefit cows in lactation, and in heat stress situations.
