**From page 15**

COPPER chaperone proteins have been well characterized. CCS, a copper chaperone protein, transports copper to most target proteins in the mitochondrion and metalloprotein (in the cytosol). For example, the chaperone, COX17, transports copper to proteins in the mitochondria that transfer copper from cytosol to the mitochondria inner membrane. The copper chaperone ATOX1 transports copper to CuA/Pase 7a and 7b in the trans-golgi network. All three of the copper chaperone proteins are expressed in pigs (Fry et al., 2012) and cattle (Fry et al., 2015). Zinc does not change valence states in the body but remains in the distal state. In contrast to iron and copper, zinc is generally not considered a pro-oxidant. However, the effect of zinc on antioxidant status depends on the concentration of zinc and the presence of other essential trace minerals. The legislation reaffirms the original intent of the CWA and provides guidance on what requires federal intervention. The House has a similar version, the Senate Environment & Public Works Committee called the bill “moderate” and said it is important that Congress to intervene and propose a rule to trigger a veto of the bill. However, if the bill is referred to the Senate Environment & Public Works Committee, it will be referred to the Senate Environment & Public Works Committee, which already supports S. 1184. Hektkamp called the measure “considerably more” than what has been proposed in Congress. The House Appropriations Committee cleared floor debate on water and energy bill, which was blocked by the EPA water rule. House Democrats fear that the rider could trigger a veto of the bill. Senate sponsors discussed water concerns of EPA rule. EPA and Corps proposed water rule would expand the scope of federal authority over land and water in wetlands and all water in a floodplain, manmade water management systems and water that infiltrates the ground, as well as any other water that they deemed significant to be discharging to downstream water based on use by animals, insects and birds and water storage.
